

Think engineering is just boring textbook problems? Wrong. Rebecca Johnson already knows engineering can take you to high places-especially when you dive right in! While still a University of Kentucky student she's just jump-started her career in the space industry working with NASA engineers to redesign equipment on the shuttle and the international space station. Sound pretty cool? There's more at [nasa.gov](http://nasa.gov)

Working in your field while you go to college is called Engineering Cooperative Education. Rebecca will graduate with an engineering degree, at least a year's experience in her field, earn a salary, and have fun in the process. Sound too good to be true? Wrong again. Check it out at [engineering-rocks.uky.edu](http://engineering-rocks.uky.edu)
